

# Depression in Taiwan

*From past, present to future*

Tung-Ping Su, MD

Professor

Department of Psychiatry

Faculty in Medicine, National Yang-Ming University Taipei Veterans General Hospital, Taipei, Taiwan

Jan. 8, 2012 Dr. Stanley Ho Medical Development Foundation Symposium at Macau

***Epidemiology***

***Clinical pharmacological practice  
pattern***

***Brain imaging and  
Neuromodulation***

# Epidemiological studies of depression in Taiwan

- 1980s: lifetime prevalence of major depression **1.1%** by DIS (Hwu, & Weissman 1996), *lower end* of the spectrum worldwide
- 1990s: one-month prevalence **5.9%** of major depression and **15.3%** of depressive neurosis in the *elderly* by GMS, (Chong et al 2001)
  - *Risk factor: widows with low educational levels (urban area) and among those with physical illness*
- 2003-2005: a nationally representative sample survey: lower lifetime prevalence (**1.2%**) of major depression by WMH-CIDI (Liao & Lee, 2011)
  - *Risk factors: divorced, widowed, age <=40 and females, rural residents were lower risk for MDD*
  - Only *1/3 MDD* sought help, despite loss *twice* the No of workdays vs. US sample (*cultural stoicism*, high tolerance)

- Data from
- Taiwan Suicide Prevention Center
- 2011, 10,04

## **Suicide Update in Taiwan**

# Suicide mortality rate from 1994 through 2010

# Suicide mortality rate by gender (1994 to 2010)

# Suicide mortality rate by age levels (1994 to 2010)

# Suicide mortality rate by age level (1994 to 2010)

## Male

## Female

# 「由其他氣體及蒸氣自殺」自90年起明顯增加

99年「由其他氣體及蒸氣自殺」佔率(31.42%)，已近與「吊死、勒死及窒息」(31.47%)並列第一位，持續將燒炭自殺列為重要防治措施。

# Increasing the reported number of suicidal people across 2006 to 2011

# Mass media effects

Andrew Cheng “book: Media and suicide”

---

- May, 2005, a famous TV / movie star Mr. Ni who hung himself on the tree
  - Reported continuously for 17 days with 1.5 pages of newspapers daily for the details of suicide methods and his family
  - TV reported this event hourly for the initial few days
  - He was recognized by mass media as a ‘hero’
  - Induced increased suicide rate subsequently by imitation
- This inappropriate report then was requested to have self-regulation by adhering the rules set by the government, Administrative Yuan

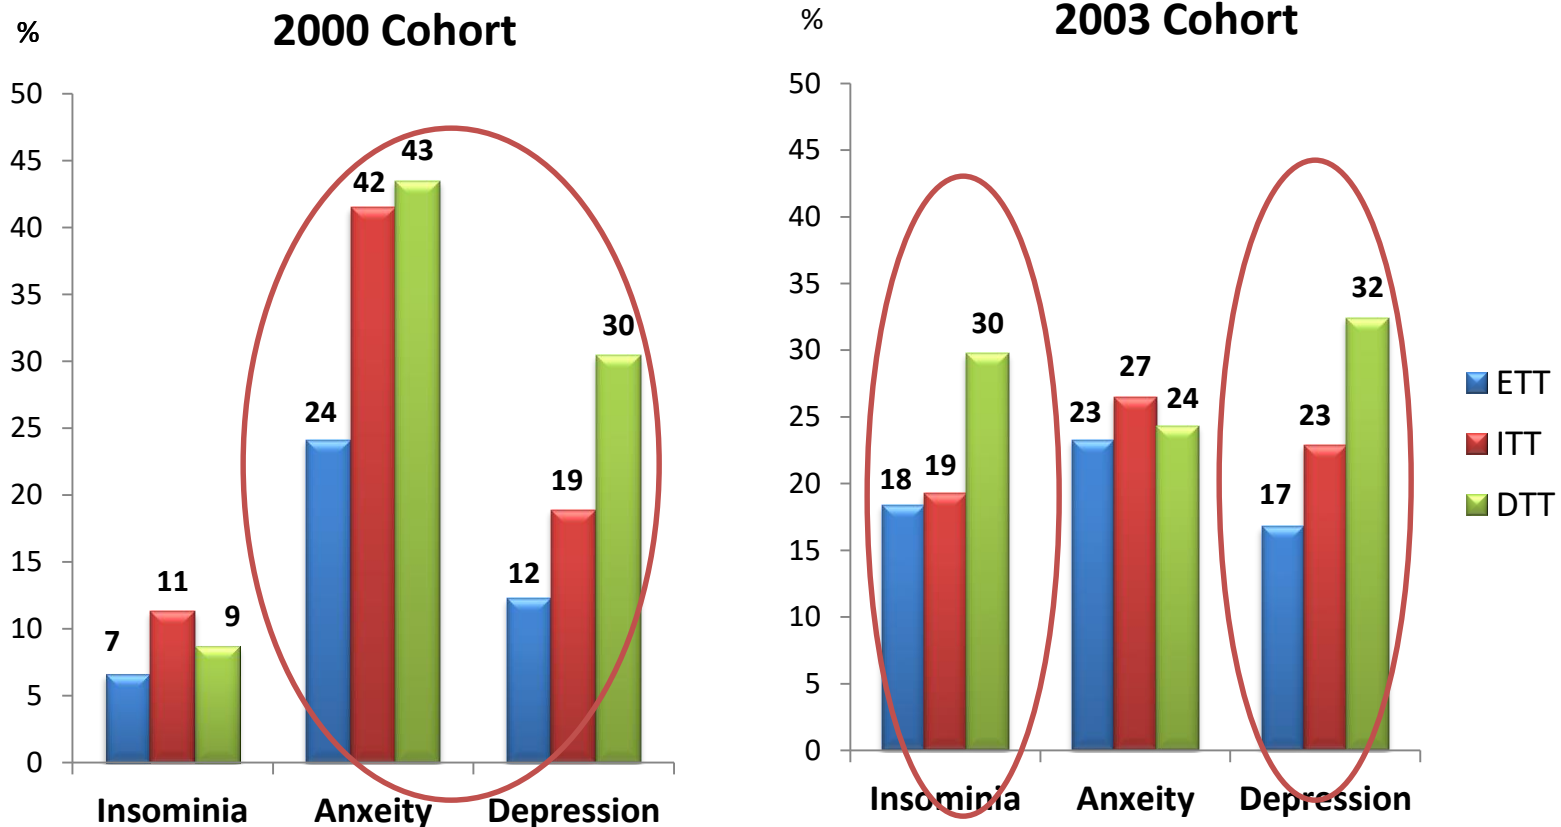

# Increased awareness of depression in Taiwan

- From *neuroasthenia* to depression took a long way
- From *social stigma* to *cultural stoicism*
- The effect of urbanization with increase of divorced rate and other traumatic events
- There is *much room for improvement* in raising the Taiwanese public's awareness about MDD and encouraging their *willingness* to seek professional help. The following organizations were established :
  - 2002: Taiwan Association Against Depression (TAAD)
  - 2005: Taiwan Suicide Prevention Center (TSPC)
  - Suicide mortality rate went down from 19.3 to 16.8 persons/100,000

# Prevalence of mood disorders 1996 to 2009

# Less severe mood disorders preceded the diagnosis of MDD (within two years)

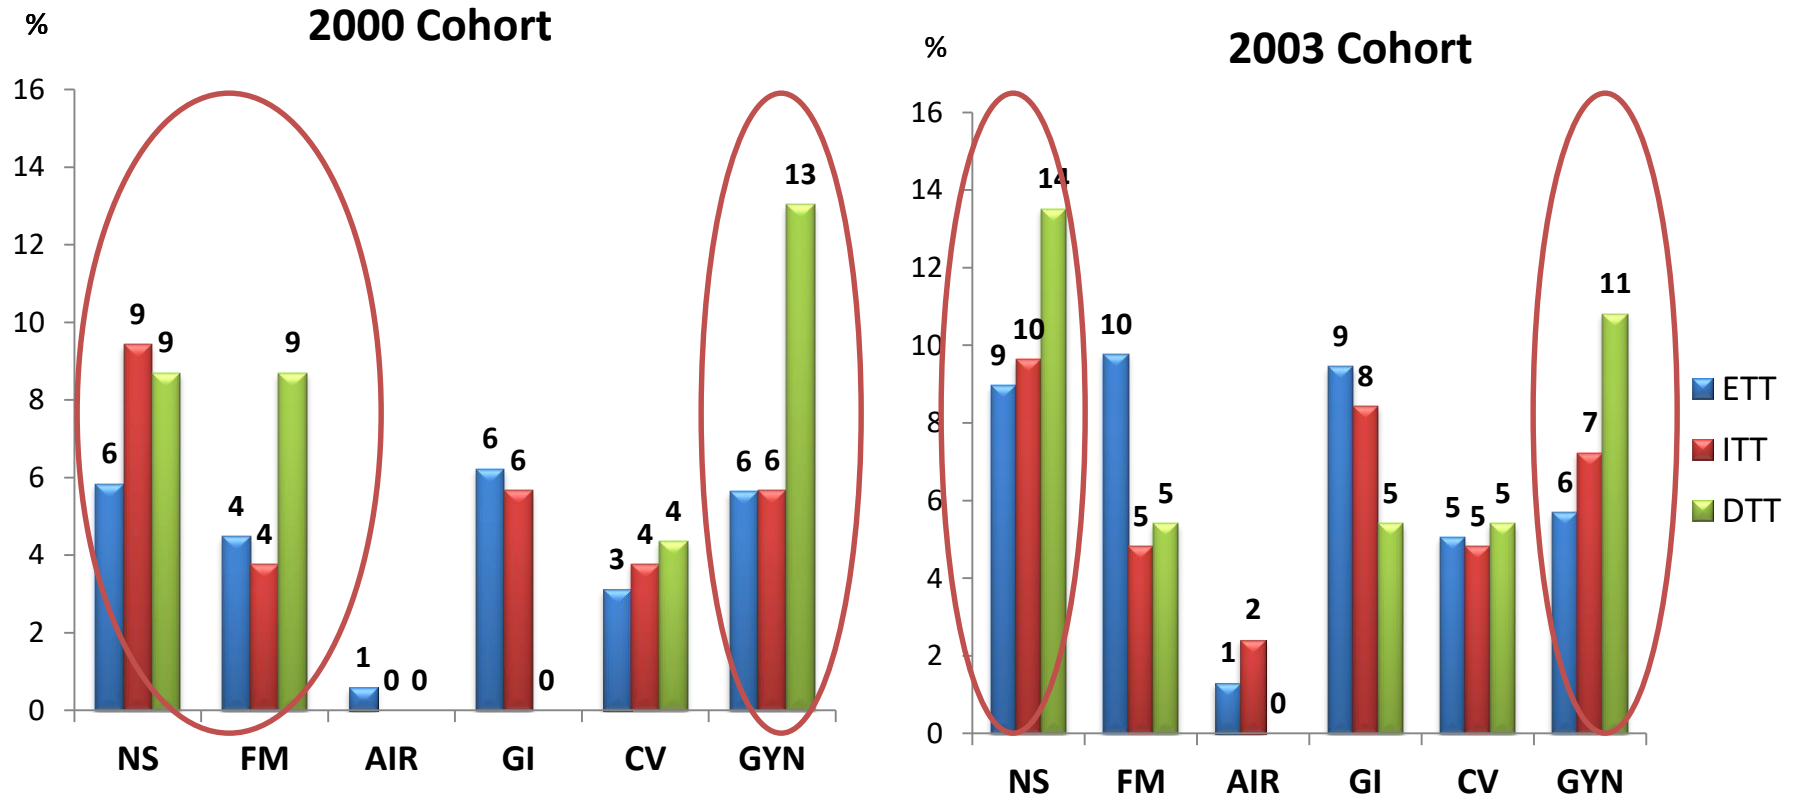

ETT: easy to treat (no change of any given ATD)

ITT: intermediate level of difficult to treat (change once after an adequate ATD trial)

DTT: difficult to treat (change over two times after an adequate ATD trial)

# Visits of non-psychiatric clinic Before MDD diagnosed at psychiatry clinic

ETT: easy to treat (no change of any given ATD)

ITT: intermediate level of difficult to treat (change once after an adequate ATD trial)

DTT: difficult to treat (change over two times after an adequate ATD trial)

# **Outpatient Practice and antidepressant Utilization in Taiwan 2000 -2009**

Tung-Ping Su TVGH

# Data Source

- National Health Insurance program covering **96-99%** of 2.3 million people in Taiwan
- National Health Insurance data collected from 2000-2009, based on **2005 one million sampling** set
- All prescriptions included antidepressants from 2000-2009 were **1,673,345** in total
  - Antidepressant:  
ATC code of Drug : **N06A**  
**168 drugs, 19 subclasses**

# No. of patients by age, gender

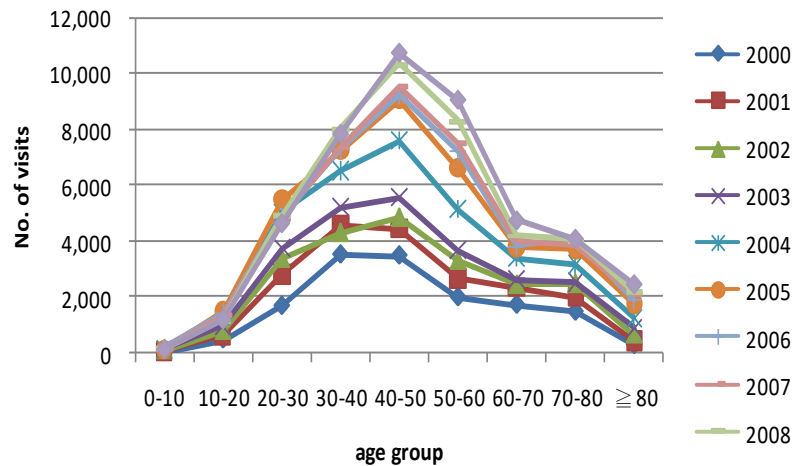

# No. of **outpatient visits** with antidepressant prescription: 2000-2009

*Psychiatry vs. Non-psychiatry*

# Outpatient visit with ATD prescriptions by age

## Psychiatric Male

## Psychiatric Female

## Non- Psychiatric Male

## Non- Psychiatric Female

# Prevalence of patients utilizing antidepressant with age distribution: Psychiatry vs. Nonpsychiatry (2009)

# Number of prescribed antidepressants from 2000-2009

Number of Antidepressants	Psychiatric outpatient prescriptions	%	Non-psychiatric outpatient Prescriptions	%	total prescriptions	%
1	705,147	88.99	724,425	96.45	1,429,572	92.62
2	85,624	10.81	24,880	3.31	110,504	7.16
3	1,582	0.20	1,680	0.22	3,262	0.21
4	34	0.00	99	0.00	133	0.01
5	0	0.00	1	0.00	1	0.00

***Prescription, DDD and Cost  
of Antidepressants  
(2000 – 2009)***

# Prescription of antidepressants in Taiwan 2000-2009

# Prescription of antidepressants in Taiwan Psychiatric outpatients (2000-2009)

# Prescription of antidepressants in Taiwan: Non-Psychiatric outpatients (2000-2009)

# Total cost of antidepressant use in Taiwan 2000-2009

*Psychiatry vs. non-psychiatry ratio= 4 : 1*

# Comparison of total cost of different antidepressant use (2000 – 2009)

*Prevalence of  
Antidepressant utilization  
(2000 – 2009)*

# Prevalence of antidepressant utilization by gender (2000-2009)

*Female more use than male*

# Prevalence of patients utilizing antidepressants, Psychiatry vs. non-psychiatry (2000-2009)

*Non-psychiatry more use than Psychiatry*

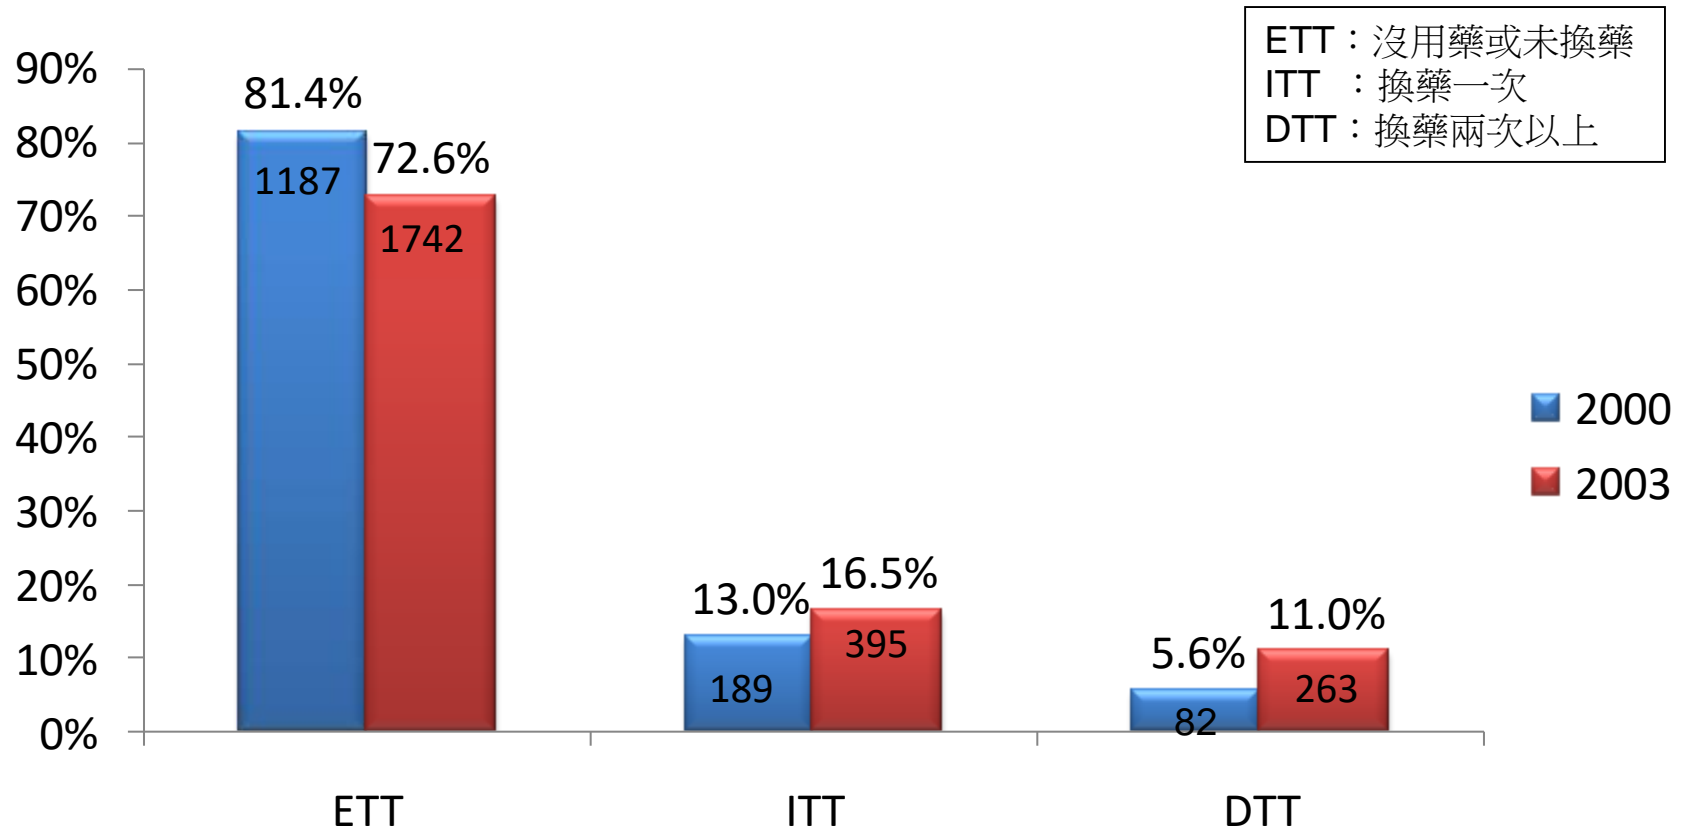

**Change diagnosis**  
*from*

***Depression to***

***Bipolar disorder***

# Distribution of different severity level of major depression in cohort 2000 and cohort 2003

ETT: easy to treat (no change of any given antidepressant s)

ITT: intermediate level of difficult to treat (change once after an adequate antidepressant trial)

DTT: difficult to treat (change over two times after an adequate antidepressant trial)

# Switching rates over time (Cohort 2000)

四組用藥情況從MDD->BPD的改變率

Switch to possible BPD I = 13.7% (hospitalization  $\geq$  2 times)

Switch to possible BPD II = 86.3% (hospitalization  $<$  2 times)

# Switching rates over time (Cohort 2003)

四組用藥情況從MDD->BPD的改變率

Switch to possible BPD I = 6.7% (hospitalization  $\geq$  2 times)  
Switch to possible BPD II = 93.3% (hospitalization  $<$  2 times)

# Prevalence rates of bipolar disorder

**Increased clinician's awareness about bipolar disorders over time !**

2000年 2001年 2002年 2003年 2004年 2005年 2006年 2007年

# Remitting MDD vs. Normal\_ hypometabolism

Two sample t-test :

K=200 voxels

Cluster-level, Pcorrected<0.001

SPMresults: \Remitted vs. Normal  
Height threshold T = 3.50

Z-score	Brain area	Coordinate Atlas
5.76	<b>Right</b> Cerebrum, <b>Medial Frontal Gyrus</b> , BA 9, Range=3	8,42,32
3.92	<b>Left</b> Cerebrum, <b>Middle Frontal Gyrus</b> , BA 9/10, Range=1	-28,58,10
3.89	<b>Left</b> Cerebrum, <b>Medial Frontal Gyrus</b> , BA 10, Range=0	-4,52,2
3.73	<b>Left</b> Cerebrum, <b>Sub-lobar, Insula</b> , BA 13, Range=0	-40,16,-2

# Non-remitting MDD vs. Normal\_ hypometabolism

Two sample t-test :

K=200 voxels

Cluster-level, Pcorrected<0.001

SPMresults: \Nonremitted vs: Normal  
Height threshold T = 3.50

Z-score	Brain area	Coordinate Atlas
4.78	Left Cerebrum, <b>Orbital Frontal Gyrus</b> , BA 11, Range=2	0,44,-20
4.77	Left Cerebrum, <b>Inferior Parietal Gyrus</b> , BA 40, Range=0 (fusiform)	-42,-54,52
4.76	Right Cerebrum, <b>Sub-lobar thalamus</b> , Range=1	2,-12,2
4.48	Left Cerebrum, <b>Middle Frontal Gyrus</b> , BA 8, Range=2	-48,12,36
4.38	Right Cerebrum, <b>Superior parietal lobe</b> , BA 40, Range=0	42,-66,50
3.95	Right Cerebrum, <b>Parietal lobe, Precuneus</b> , BA 7, Range=2	10,-70,52

# Remitted Medication-Resistant Depressive $\approx$ BD

**Very similar** based on visual inspection !!!!!

**BD1** *Remitted*

**MRD** *Remitted*

**BD2** *Remitted*

*MRD* → *Bipolar Spectrum*

# ***Neuromodulation***

## ***rTMS***

*Repetitive transcranial  
magnetic stimulation*

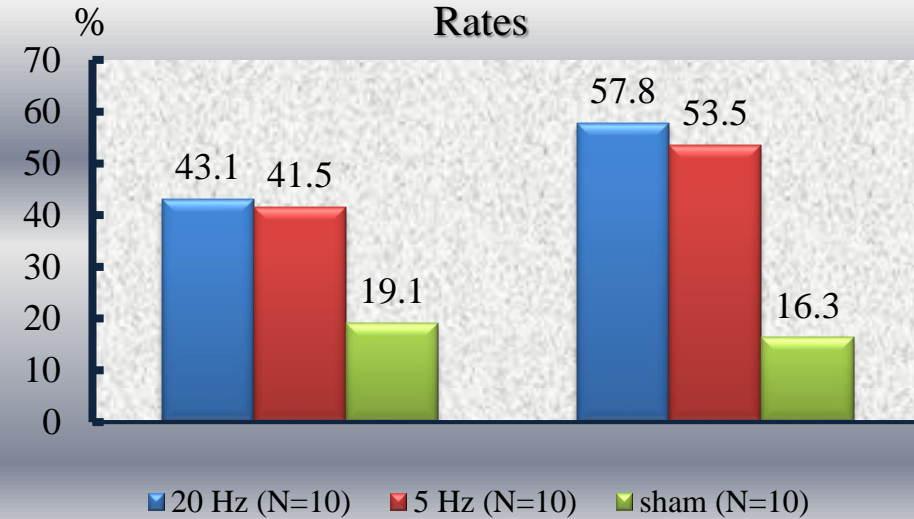

## ***DBS** in the future*

*Deep brain stimulation*

**MRI-navigated to**  
**Left Dorsolateral PFC**

# Improvement of HAM-D-17 score & response rate with 2-week active VS. sham rTMS

**Table 2. Scores on the Clinical Rating Scales of 3 rTMS Groups Over Time<sup>a</sup>**

Rating Scale	Baseline			Week 1			End of Treatment			ANOVA-R	
	Active	Active	Sham	Active	Active	Sham	Active	Active	Sham	F <sup>b</sup>	p
	20 Hz (N = 10)	5 Hz (N = 10)	(N = 10)	20 Hz (N = 10)	5 Hz (N = 10)	(N = 10)	20 Hz (N = 10)	5 Hz (N = 10)	(N = 10)		
HAM-D	23.2 (7.5)	26.5 (5.2)	22.7 (4.7)	13.2 (5.6)	15.5 (6.4)	18.3 (6.7)	9.8 (7.1)	12.3 (7.7)	19.0 (7.7)	4.8	< .01
BDI	28.0 (9.1)	33.9 (7.6)	33.4 (9.6)	22.1 (8.7)	24.0 (10.5)	27.9 (13.7)	12.8 (6.7)	19.7 (12.3)	28.7 (15.1)	3.5	.01
CGI-S	4.5 (0.7)	4.7 (0.8)	4.7 (0.48)	3.2 (0.8)	3.5 (0.7)	4.0 (0.9)	2.8 (1.1)	2.7 (1.2)	3.6 (1.1)	1.2	NS
HAM-A	16.5 (7.1)	20.6 (3.5)	18.8 (3.9)	12.0 (5.2)	12.6 (6.3)	14.6 (5.5)	11.1 (10.8)	10.7 (7.1)	12.8 (4.6)	1.2	NS

<sup>a</sup>Only subjects who completed the entire study are included. Data are given as mean (SD).

<sup>b</sup>df = 4,54.

Abbreviations: ANOVA-R = repeated measures analysis of variance, BDI = Beck Depression Inventory, CGI-S = Clinical Global Impressions-Severity of Illness, HAM-A = Hamilton Rating Scale for Anxiety, HAM-D = Hamilton Rating Scale for Depression, NS = not significant, rTMS = repetitive transcranial magnetic stimulation.

(Su et al., Journal of Clinical Psychiatry, 2005)

# rTMS in refractory depression

- Not every rTMS paradigm is equally effective
  - Most effective:
    - High-frequency ( $\geq 5$  Hz)
    - Over left dorsolateral prefrontal cortex (DLPFC)

Fitzgerald, P.B., Daskalakis, Z.J., The effects of repetitive transcranial magnetic stimulation in the treatment of depression. Expert Rev Med Devices 2011: 8, 85-95.

*Repetitive Transcranial Magnetic  
Stimulation*

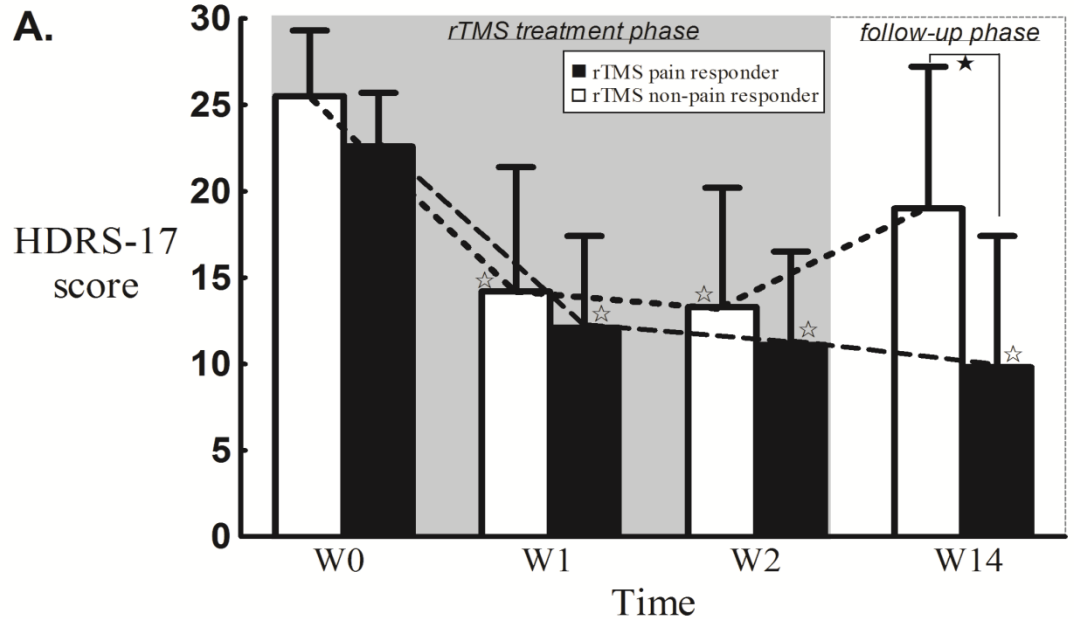

*rTMS*

Antidepressant effects

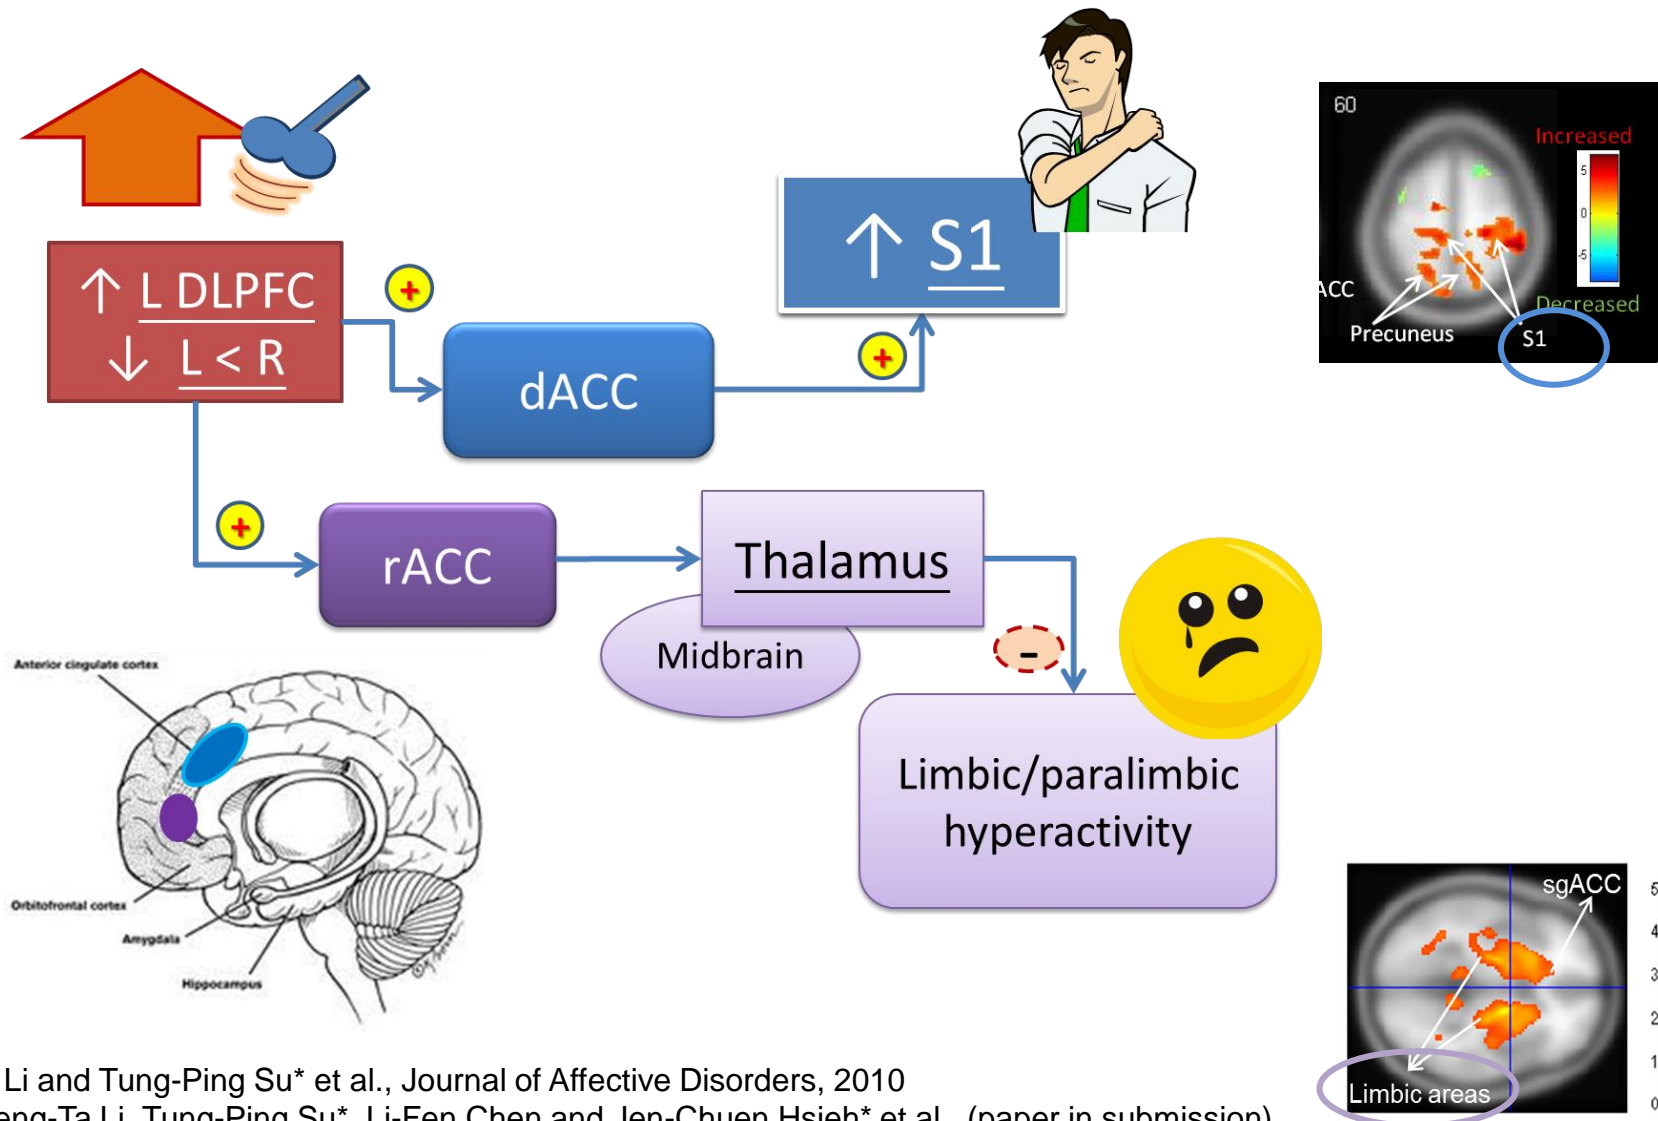

Left prefrontal rTMS

Analgesic effects

# Dissociable rTMS mechanisms on pain and depression: a combined PET, MEG and TMS study

1. CT Li and Tung-Ping Su\* et al., Journal of Affective Disorders, 2010

2. Cheng-Ta Li, Tung-Ping Su\*, Li-Fen Chen and Jen-Chuen Hsieh\* et al., (paper in submission)

# *Future target*

---

- Continued to **reduce suicide rate**
- Integrated research in mood disorders
  - Epidemiology, brain imaging, and molecular genetics (e.g., **pharmacogenetics**)
  - **Biomarkers (classifier)** for bipolar and unipolar depression
- Clinical trial for **novel** antidepressants
- Development of **neuromodulation** techniques
  - rTMS / tDCS (transcranial direct current stimulation)
  - DBS (deep brain stimulation)
- Education for mood disorders to **reduce stigma**

***Thank you  
for your attention***
