Quality improvement in surgery

Paul BS LAI

Department of Surgery

The Chinese University of Hong Kong

Patients need “high value health care”

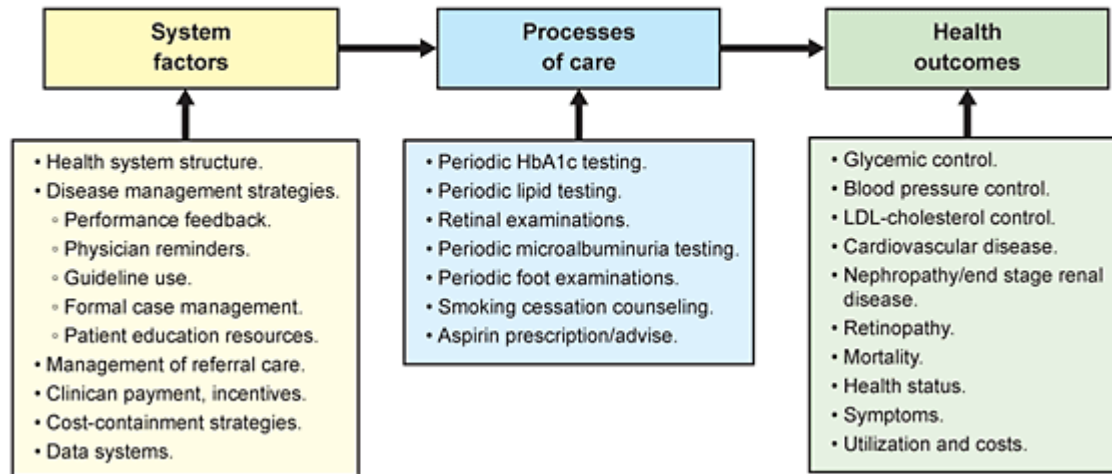

- **Quality**
 - Structure, process, outcome
- **Safety**
 - Avoid preventable harms
- **Appropriate use of resource**
 - Avoidable procedures
- **Patients' experience**
 - Did we ever ask?

What is quality?

- Oxford Dictionary Definition:
 - The standard of something as measured against other things of a similar kind; the degree of excellence of something.
- Quality means differently to different people.

The Donabedian Model (1966) structure - process - outcome

Figure 2. TRIAD conceptual model of relationships among system-level factors, processes, and outcomes of care

essentially the whole patient journey

6 dimensions of quality healthcare

- ***effective***
 - delivering health care that is adherent to an evidence base and results in improved health outcomes for individuals and communities, based on need;
- ***efficient***
 - delivering health care in a manner which maximizes resource use and avoids waste;
- ***accessible***
 - delivering health care that is timely, geographically reasonable, and provided in a setting where skills and resources are appropriate to medical need;
- ***acceptable/patient-centred***
 - delivering health care which takes into account the preferences and aspirations of individual service users and the cultures of their communities;
- ***equitable***
 - delivering health care which does not vary in quality because of personal characteristics such as gender, race, ethnicity, geographical location, or socioeconomic status;
- ***safe***
 - delivering health care which minimizes risks and harm to service users.

Targeting high value surgical care?

$$\text{Value} = \frac{\text{Quality}}{\text{Cost}}$$

My NHS – NHS Choices

The screenshot shows a web browser window with the URL www.nhs.uk/Service-Search/performance/search. The page title is "My NHS – NHS Choices". The main content area features the "My NHS BETA" logo and the tagline "Data for better services". A navigation link for "NHS Choices" is visible in the top right. The primary heading is "Performance information to support transparency and drive quality". Below this, a paragraph explains that data transparency will help drive quality and create better services, and that users can see key data used by the NHS and local councils. A second paragraph invites user feedback. To the right of the text is a portrait of a man in a dark jacket and a green circular icon with a white checkmark. Below the text is a section titled "Explore the data" which contains six interactive cards, each with a small bar chart icon and a title: "Hospitals", "Social care", "Public health services", "Public health outcomes", "Mental Health Hospitals", and "Consultants". Each card provides a brief description of the data available.

Performance information to support transparency and drive quality

Making our data transparent will help to drive up quality and create even better services. Here you can see key data used by the NHS and local councils to monitor performance and shape the services you use. We'll continually add to the information, listen to what you want, and work to make it as clear as possible.

We want your [feedback](#) on the contents and presentation of this site, whether you are a care professional, clinician, manager, carer or a member of the public.

GMC Number: **4133379**

Hospital(s): **Royal Infirmary Edinburgh**

Special Interests: **Adult Cardiac Surgery**

Surgeon Overview

Number and type of operations performed

In-hospital mortality rate (risk adjusted)

Average patient risk profile

[See other Surgeons](#)

[Back](#)

This graph shows the number and percentage of each type of heart surgery done by this consultant surgeon. The number of operations is shown in the line going up the left hand side. The percentage (%) underneath each coloured bar shows how much of this consultant's heart surgery is made up each procedure type.

The 'key' underneath the graph shows what procedure(s) each coloured bar shows. The abbreviations used are explained below:

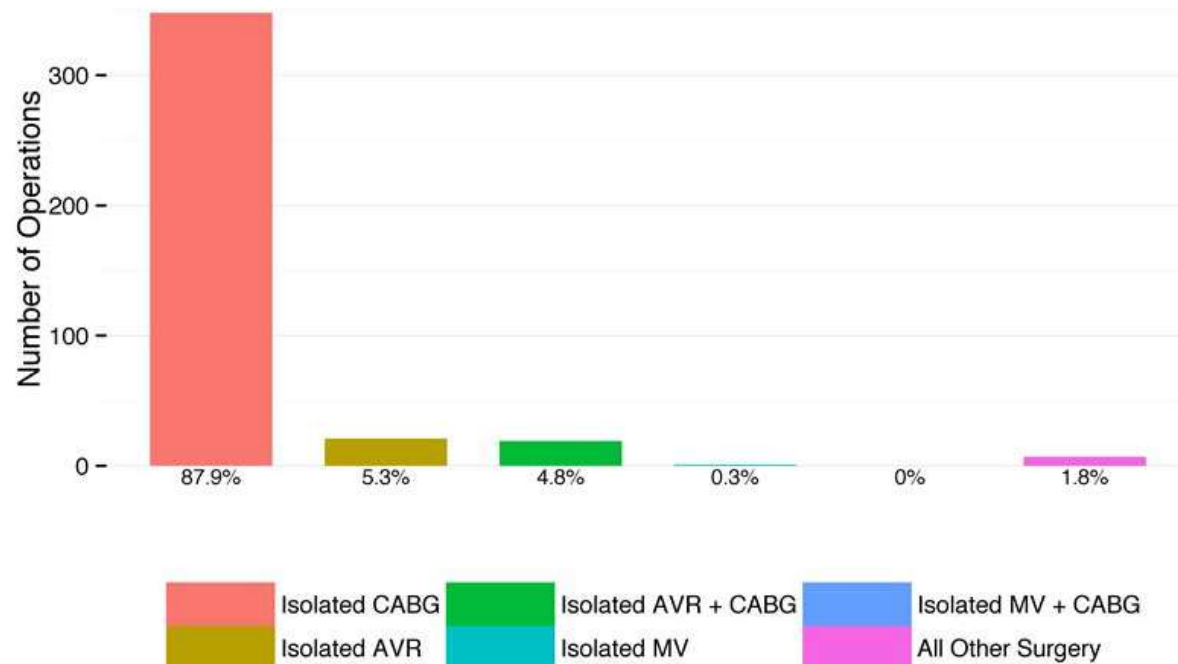

- **Isolated**: This procedure has been carried out on its own. No other procedures were done during the same operation.
- **CABG**: Coronary artery bypass grafting
- **AVR**: Aortic valve replacement
- **MV**: Mitral valve procedure

You can find out more about these procedures in the '[About cardiothoracic surgery](#)' section. If you or someone you know is having heart surgery, it may be helpful to know whether the consultant does lots of that procedure. If you have questions or concerns about the number of procedures being done at your hospital, you should speak to your heart surgeon.

[Click here for help understanding this graph](#)

Data For Period April 2010 - March 2013

Practice Profile

This graph shows the percentage of patients who die before being discharged from the hospital they had their operation at. This is called the 'in-hospital mortality rate'.

Some consultants do more complicated surgery on patients who are more sick, whilst others do fairly routine surgery. So that we can make fair comparisons between these consultants, the mortality rate has been 'risk adjusted' to take into account the difficulty of each operation.

The green line in the middle of the graph shows the average mortality rate for heart surgery in the UK. The blue dot shows the risk adjusted mortality rate for the consultant you are looking at. The lower the blue dot is on the graph, the lower the percentage of patients who have died after surgery.

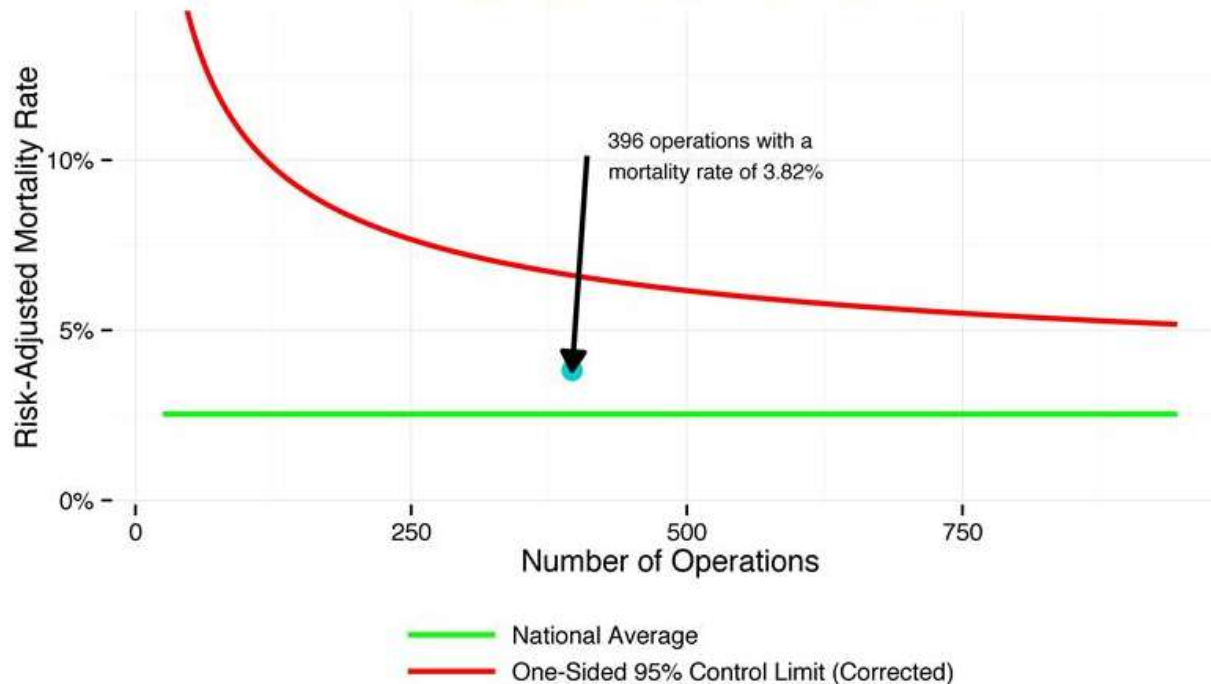

If the blue dot is underneath the red line near the top of the graph, then the mortality rate shown by the blue dot is within the limits we would expect.

For more information on understanding mortality rates, look at the [Understanding the graphs](#) page

[Click here for help understanding this graph](#)

Data For Period April 2010 - March 2013

Risk Adjusted In-Hospital Mortality Rate

Some risk factors like age, gender, and other medical problems can affect the outcome of heart surgery.

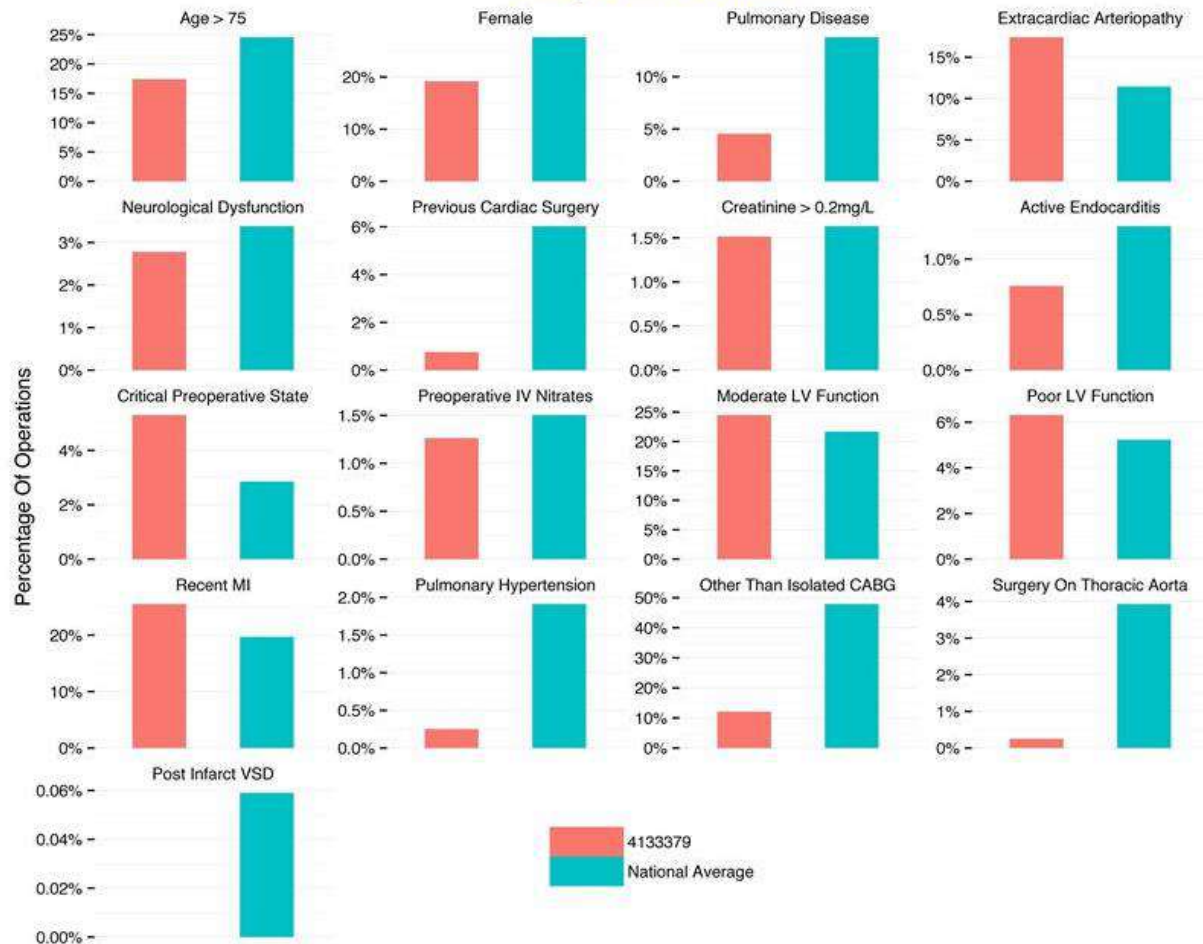

Each of the graphs below shows what percentage of this consultant's patients have each risk factor (peach bar on the left) next to the average for the whole of the UK (green bar on the right). This can tell you whether the consultant operates on high risk patients in general, and whether they specialise in doing particular types of complicated surgery, like operations on the thoracic aorta.

You can find out more about the risk factors in the 'About cardiothoracic surgery' section.

track-record may not mean anything ...

Stop publishing individual surgeons' death rates

Most deaths are related to team dynamics and hospital infrastructure, says **Stephen Westaby**

A surgeon was recently castigated in the press for allegedly manipulating operative data.¹ Repeating the US experience, publication of surgeon specific mortality data (SSMD) has shifted emphasis from patient care to self preservation.^{2,3}

In the 1980s the US Health Care Financing Administration collected but did not disclose individual death rates for New York state cardiac surgeons.³ A newspaper sued and then published the information, but was criticised, and soon afterwards, risk averse behaviour and gaming with risk stratification were widely documented.⁵

The answer was to avoid high risk patients. In Massachusetts, the risk profile in centres with higher mortality fell.³ Cardiologists struggled to obtain coronary artery bypass grafts for comorbid patients, but not in

with infrastructure and process.¹⁹ Only 30% of the deceased patients had received satisfactory postoperative care.

Because few deaths are related to surgical error, publication of SSMD diverts attention from deficiencies in NHS infrastructure. An understanding of why patients die allows something to be done about it; attributing a pile of bodies to an individual surgeon does not.

Risk averse behaviour benefits neither patients nor the profession. Surgeons will endorse truly transparent outcome data that contribute to patient safety, such as the star rating system.⁵ In Berwick's commissioned review of the NHS after the Francis inquiry, he reiterated that hospitals not individuals must be held accountable for poor outcomes.²⁰ Surely the surgical royal colleges knew this. Soon afterwards, SSMD were released for other surgical specialties and interventional

and Safety
Division)**

Surgical Outcomes Study 1995-96

only crude mortality/morbidity rates

Clinical Surgical Audit Unit (CSAU) 2002-2006

- One full time nurse and one part-time surgeon
- Backed up by OTRS, ePR, CDARS
- Followed the UK practice of comparative audits

Comparative Audit 2002 - 2006

<i>Year</i>	<i>Topics</i>	<i>Risk-adjustment</i>	<i>Focus of comparison</i>
2002	Hepatectomy Esophagectomy Liver Transplantation	No No No	Mortality
2003	Total cystectomy	Yes	Mortality
2004	Laparoscopic surgery Whipple's operation	No Yes	Trend Mortality
2005	Emergency colectomy Major lung resection	Yes Yes	Mortality Mortality and survival
2006	Esophagectomy – second audit Ca rectum	Yes	Mortality Mortality and survival

Completing the audit cycle

- 1st HA audit in 2002 (1/1997 to 6/2001) found that HA esophagectomy in-hospital mortality rate was 11%.
- Once this information was released, our colleagues started to improve;
- 2nd HA audit in 2006 (7/2001 to 2005) showed dramatic improvement.

Objective

To provide reliable risk-adjusted morbidity and mortality rates after major surgery to the 123 Veterans Affairs Medical Centers (VAMCs) performing major surgery, and to use risk-adjusted outcomes in the monitoring and improvement of the quality of surgical care to all veterans.

Summary Background Data

Outcome-based comparative measures of the quality of surgical care among surgical services and surgical subspecialties have been elusive.

Methods

This study included prospective assessment of presurgical risk factors, process of care during surgery, and outcomes 30 days after surgery on veterans undergoing major surgery in 123 medical centers; development of multivariable risk-adjustment models; identification of high and low outlier facilities by observed-to-expected outcome ratios; and generation of annual reports of comparative outcomes to all surgical services in the Veterans Health Administration (VHA).

Results

The National VA Surgical Quality Improvement Program (NSQIP) data base includes 417,944 major surgical procedures performed between October 1, 1991, and September 30, 1997. In FY97, 11 VAMCs were low outliers for risk-adjusted observed-to-expected mortality ratios; 13 VAMCs were high outliers for risk-adjusted observed-to-expected mortality ratios. Identification of high and low outliers by unadjusted mortality rates would have ascribed an outlier status incorrectly to 25 of 39 hospitals, an error rate of 64%. Since 1994, the 30-day mortality and morbidity rates for major surgery have fallen 9% and 30%, respectively.

Conclusions

Reliable, valid information on patient presurgical risk factors, process of care during surgery, and 30-day morbidity and mortality rates is available for all major surgical procedures in the 123 VAMCs performing surgery in the VHA. With this information, the VHA has established the first prospective outcome-based program for comparative assessment and enhancement of the quality of surgical care among multiple institutions for several surgical subspecialties. Key features to the success of the NSQIP are the support of the surgeons

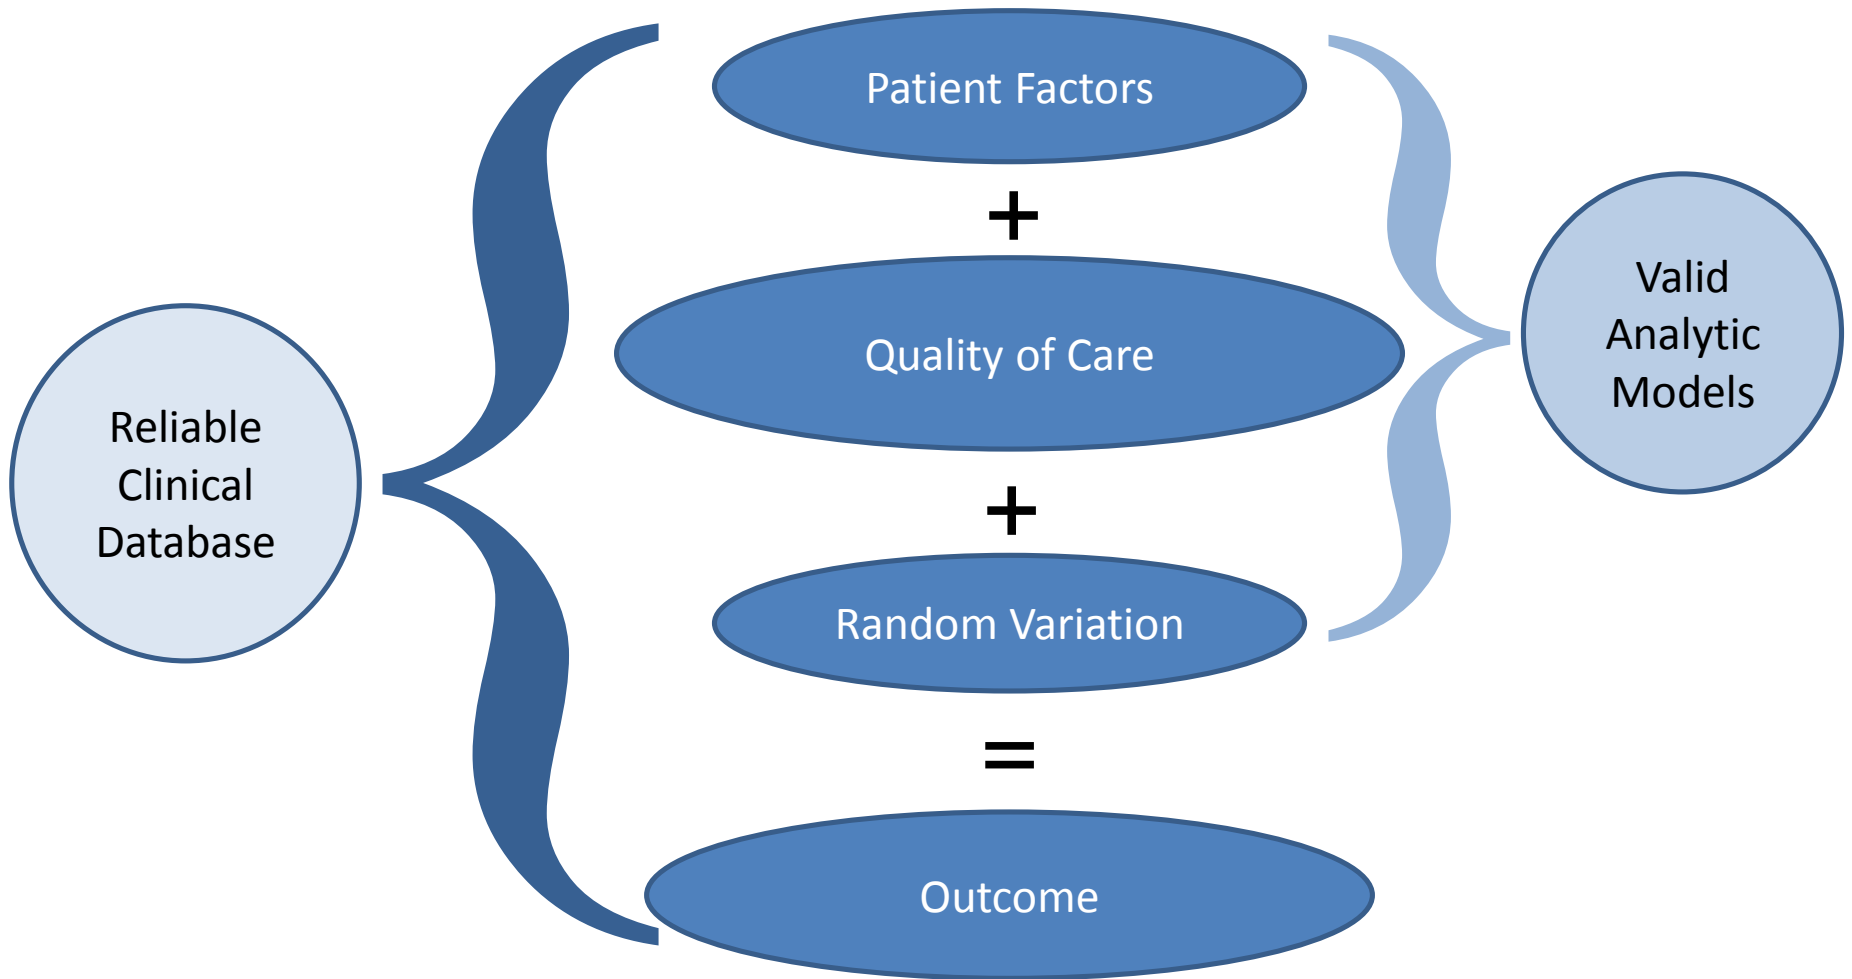

Surgical Outcomes Monitoring and Improvement Program (SOMIP)

- Started in 2008
- Elective and emergency operations (~250,000 procedures per year)
- Major and Ultra-major operations
- Covers General surgery, Urology, Plastic and Paediatric surgery
- 66 risk factors
- Collect post-operative mortality and morbidity at 30-, 60- and 90-day

Special features of SOMIP/NSQIP

- Focus on hospital, rather individual surgeon (17 HA hospitals)
- Single-year comparison and continuous monitoring
- Compare a bundle of operations rather than individual operation
- A comprehensive set of variables to help construct risk-adjusted models with high discriminative power (C-index of 0.9)
- Robust and reliable data capturing by nurse reviewers
- All variables are well-defined and documented in a data definition manual

Why risk adjustment?

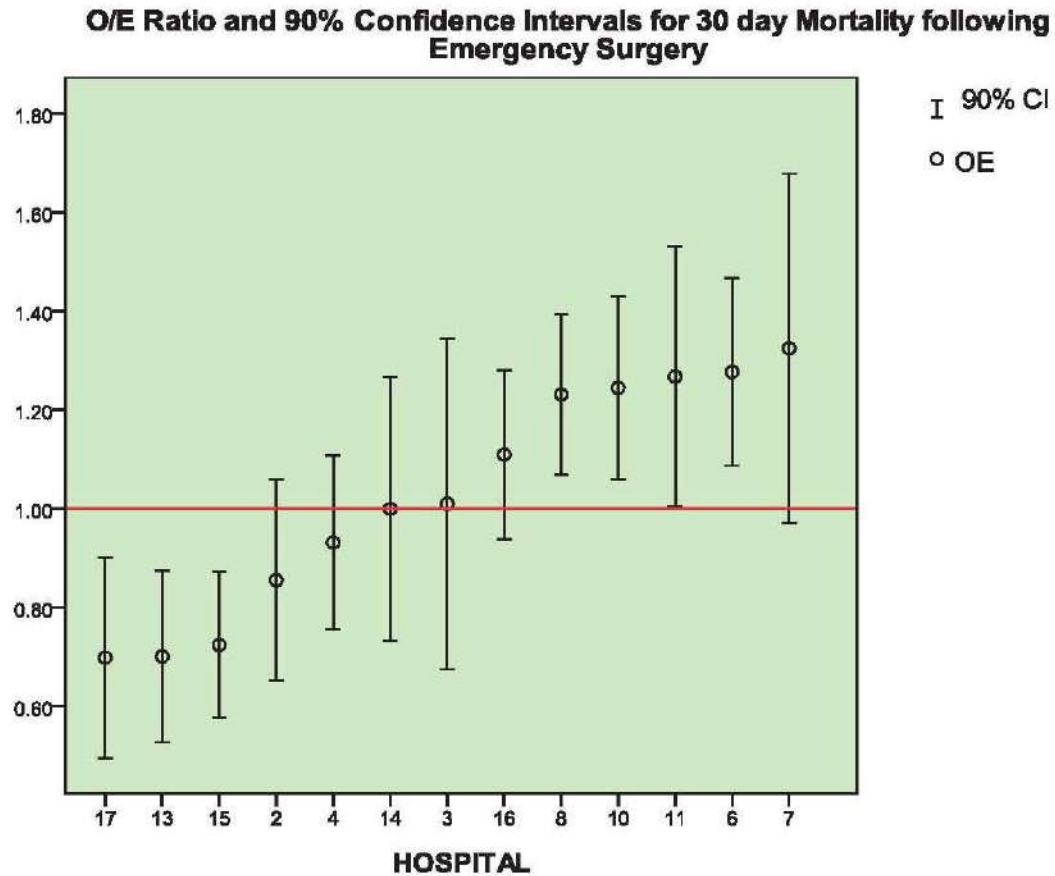

Significant variables in the model of Emergency surgery 30-day mortality

3 times	2 times	1 time
Age	Sex	weight loss
ASA	Operative Magnitude	Uncorrected bleeding tendency
Functional status	Ascites	Hepatomegaly
Neurological status	Preop dyspnea	steroid
Disseminated cancer	Sepsis/septic shock	psychosis
Severe COPD	Blood loss	Preop dialysis
Pulse		Cardiac surgery
		Systolic blood pressure
		Preop blood transfusion
		Degree of urgency
		Complexity score
Albumin	WBC	Hb
Urea/Creatinine		Haematocrit
Blood gases		Sodium
alkaline phosphatase		glucose
		bilirubin

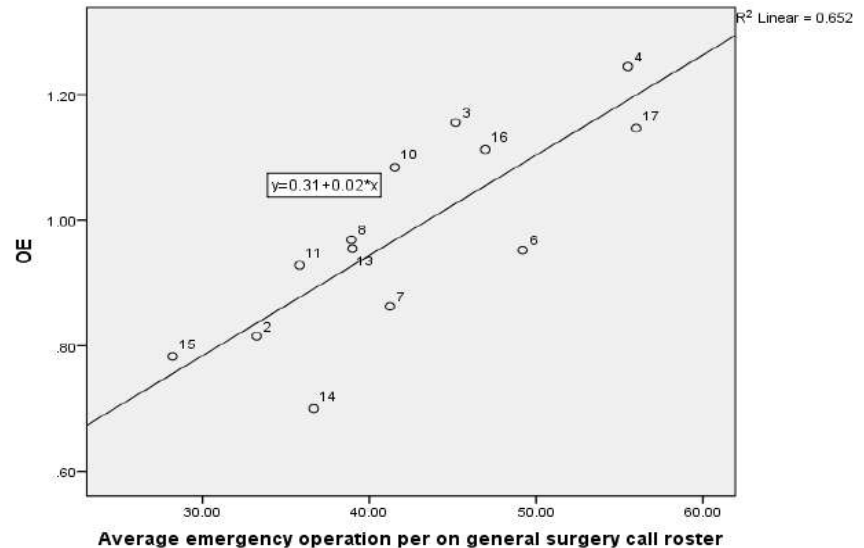

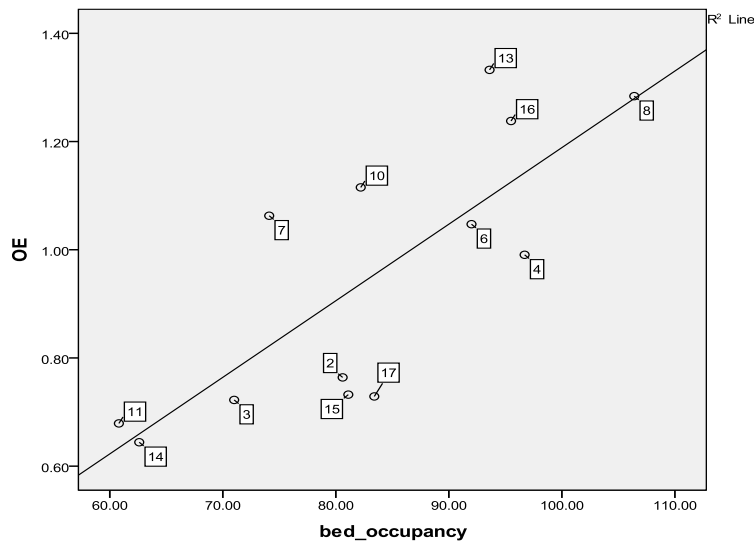

Significant variable in the model of Elective surgery 30-day mortality

3 times	2 times	1 time
Age	Operative Magnitude	Functional status
ASA	Weight loss	Neurological status
Disseminated cancer	Ascites	Angina
Presence of gangrene		Severe COPD
		Preop dyspnea
		Immunosuppression
Blood loss		Pulse
		Operation time
Urea/Creatinine	Alkaline phosphatase	Sodium
Albumin		WBC
		Bilirubin

Risk-adjusted mortality rates

Multi-level analysis to identify contributing system factors

Workload issues – no. of patients requiring surgical care

Manpower issues – surgeons, anaesthetists, intensivists, nurses, etc.

Hardware issues – ICU beds, operating theatres, ward beds, etc.

Other supports – physicians, diagnostics, interventional radiology, etc.

術後沒深切治療 死亡率較預期高33%

院緊急手術全港最差

醫管局昨公布被視為公立

醫院每年成績
表的「手術成
效監察計畫」報

告，新界東龍頭醫院威爾斯親王醫院的緊急手術成績「包尾」，術後病人死亡率比預期高出三成三。醫管局專家認為，威院緊急手術個案中，僅一成八病人使用深切治療服務，更有病人術後因病牀爆滿無法入住深切治療部，建議增加加護病牀配合；但威院在預約手術方面則錄得佳績。

記者：黃利源

最新出爐的「手術成效監察計畫」報告，覆蓋二〇一二年七月至去年六月底共二萬三千多個大型和超大型手術，其中五千三百多個為緊急手術，一萬八千多個屬預約手術。緊急手術死亡率下降至百分之七點七，預約手術死亡率則維持於百分之零點七。報告根據不同手術的預期死亡率作出調整，計算出實際與預期對比的死亡比例，如果平均數值大於一，表示實際死亡率高於預期，數值介乎〇與一之間，代表實際死亡率比預期低。

預約手術錄佳績

緊急手術	實際與預期死亡比例*
威爾斯親王醫院	1.33
屯門醫院	1.28
伊利沙伯醫院	1.24

預約手術	實際與預期死亡比例*
屯門醫院	1.88
大埔那打素醫院	1.96#
聯合醫院	1.57#

部分公立醫院外科手術
表現「倒數」排名

註：*實際與預期死亡比例大於1，代表術後死亡個案比預期多，數值愈大反映醫院表現愈差；#大埔那打素醫院和聯合醫院的「實際與預期死亡比例」平均值較高，因部分手術表現優於預期水平，未被評為表現遜色。
